

Examples of Potential Energy Problems

Study these sample problems and the methods used to solve them.

You might want to use this triangle to help you with questions involving **potential energy**.

Example:

A box has a mass of 5.8kg. The box is lifted from the garage floor and placed on a shelf. If the box gains 145J of Potential Energy (E_p), how high is the shelf?

Solution:

Use

$$E_p = mgh$$

E_p = potential energy (Joules)

m = mass of box (kg)

g = gravitational field strength (N/kg)

h = difference in height (m)

rearrange equation to find height

$$h = \frac{E_p}{mg} = \frac{145}{5.8 \times 10} = \frac{145}{58} = 2.5$$

The shelf is 2.5m high

Example:

A man climbs on to a wall that is 3.6m high and gains 2268J of potential energy. What is the mass of the man?

Solution:

Use:

$$E_p = mgh$$

Rearrange to get an equation for m.

$$m = \frac{E_p}{gh} = \frac{2268}{10 \times 3.6} = \frac{2268}{36} = 63$$

So the mass of the man is 63kg.

Example:

A 800g ball is pulled up a slope as shown in the diagram. Calculate the potential energy it gains.

Solution:

In potential energy problems we are only interested in vertical distances

Use $E_p = mgh$,

so

$$E_p = 0.8 \times 10 \times 0.2 = 1.6\text{J}$$

$$h = 20\text{cm} = 0.2\text{m}$$

$$m = 800\text{g} = 0.8\text{kg}$$

remember to change units!

The ball gains 1.6J of potential energy
